

SCEMBLIX - Mechanism of action (MOA) - HCP

[Prescribing information](#)

Image

Image

 **SCSEMBLIX**[®] ▼
(asciminib) 20 mg, 40 mg tablets

SCSEMBLIX[®] ▼ (asciminib) is indicated for the treatment of adult patients with Philadelphia chromosome-positive chronic myeloid leukaemia (Ph + CML) in chronic phase (CP), previously treated with two or more tyrosine kinase inhibitors, and without a known T315I mutation.¹

Mechanism of action (MOA)

SCSEMBLIX[®] ▼ (asciminib) is the first and only STAMP inhibitor²⁻⁴

Learn how the unique MOA of SCSEMBLIX enhances its specificity in treating CML.²

SCEMBLIX targets a different site on BCR-ABL1 - the myristoyl pocket²⁻⁴

**A Different Way to
Treat CML: SCEMBLIX¹⁻³**

 **SCEMBLIX[®]** 
(asciminib) 20 mg, 40 mg tablets

STAMP, Specifically Targeting the ABL1 Myristoyl Pocket¹

 **NOVARTIS**

Prescribing information can be found via the link above this video

VIDEO

In people who do not have CML, the myristoyl pocket is occupied by the N-terminal portion of ABL1, maintaining the protein in an inactive conformation.^{5,6}

In BCR-ABL1, the myristoyl pocket is vacant, activating the kinase.^{5,6}

Image

SCEMBLIX is a first-in-class STAMP inhibitor. Binding specifically to the myristoyl pocket, it potently inactivates BCR-ABL1 via allosteric inhibition.²

With its unique MOA, SCEMBLIX offers a different approach for treating CML⁵⁻⁷

SCEMBLIX demonstrated superior efficacy and a favourable safety profile vs bosutinib at Week 24²

[Explore the data](#)

ATP, adenosine triphosphate; BCR-ABL, breakpoint cluster region and Abelson murine leukaemia viral oncogene homologue; CI, confidence interval; CML, chronic myeloid leukaemia; CP, chronic phase; MMR, major molecular response; MOA, mechanism of action; Ph + CML, Philadelphia chromosome-positive chronic myeloid leukaemia; STAMP, specifically targeting the ABL1 myristoyl pocket; TKI, tyrosine kinase inhibitor.
